

About Me

Driven by a keen interest in data science and artificial intelligence, I have nearly 2.5 years of experience across industry and academia, specializing in data science, AI, machine learning, and IoT. I have contributed to projects spanning European government initiatives, agriculture, and power grid research, developing AI-driven and LLM-based solutions. Currently, I am actively engaged in research focused on leveraging AI for efficient power grid management, with an emphasis on advancing theoretical contributions in reinforcement learning, language-guided RL, and energy-based models. With a passion for innovation and strong leadership skills, I strive to drive transformative solutions across both academia and industry while continuously expanding my expertise in data science and AI.

Jude Ernest Paul

Machine Learning Engineer

Work Experience

Machine Learning Engineer	
Home Of Performance – Colombo	Feb 2026 – Present
Assistant lecturer	
BCAS – Colombo	Aug 2025 – Feb 2026
Associate Machine Learning Engineer	
Rootcode AI – Colombo	Feb 2025 – Aug 2025
AI Engineer Intern	
Rootcode AI – Colombo	Feb 2024 – Feb 2025

Education

Bachelor of Information Technology (Hons) Specialized in Robotics and Smart System	
ESOFT Metro Campus – Colombo	Graduated in March 2025

Skills

Data Science	Programming Language (C, C++, Python)
Machine Learning	IoT
Reinforcement Learning	Deep Learning and Artificial Intelligence
Langchain And LanGraph	Research Skills
Natural Language Processing (NLP)	Time Series
Large Language Models (LLM)	Teamwork
Embedded System	Retrieval Augmented Generation
TensorFlow And Pytorch	Agentic AI

Projects

Content Generation Tool	July 2026 - Present
Developed a social media content generation and trend detection tool to support the creative team's workflow. Built a trend detection module combining a rule-based engine with a small language model (SLM) grounded in a client-specific knowledge base, enabling the system to classify whether scraped social media posts were relevant to the client's business. Relevant trending posts then fed into a content generation module comprising separate caption generation, prompt generation, and image generation components, producing mock posts that gave the creative team a concrete starting point to iterate on rather than starting from scratch.	

ESTONIA Bürokratt	May 2025 – Aug 2025
Initiated collaboration with the Estonian government to study their digital architecture and address onboarding challenges. Currently engaged in understanding their systems and processes as part of the onboarding and learning phase.	

CLAMIGO	Dec 2024 - April 2025
Contributed significantly to the development of AI agentic services and IoT solutions for Clamigo, an AI-driven crop health management system designed to help farmers in the City of Porto enhance their farming practices and agricultural productivity. Designed and implemented AI agents using LangGraph and developed IoT devices to provide actionable recommendations for improved farming practices.	

NEURAGRID	March 2024 - Dec 2024
Conducting ongoing research on applying advanced AI algorithms for efficient power grid management. Developed a world model of the grid environment and implemented cutting-edge approaches such as Dreamer-v3 and Multi-Agent Reinforcement Learning (MARL) to optimize grid control and decision-making.	

TRADE-R	Oct 2025 – Dec 2025
Developed a deep reinforcement learning-based trading agent using PPO with a custom market-simulating environment. Designed reward functions to balance profitability and risk, enabling the agent to learn effective buy-sell-hold strategies and outperform market benchmarks.
